Responsible data management, Spring 2024

Class info
INF 385T
In-person. Wednesdays, 12:00PM- 3:00PM   UTA 1.208

Instructor
Hanlin Li, PhD, she/her, Assistant Professor
Email: lihanlin@utexas.edu Office: UTA 5.444
Office hour: Thursdays 10:30-11:30am (Zoom) and by appointment

Academic Assistant: TBD

Course Description
This course will explore common data collection, management, and sharing practices in information technology and emerging technologies. Students will examine the human, social, and ethical impact of these practices and work on group projects to design data systems that are centered around broader impact and social responsibilities.

Prerequisites for the course
None.

Required Materials
All course readings will be available via the course Canvas site.

Long Description
This course will explore common data collection, management, and sharing practices in information technology and emerging technologies, such as search engines and AI systems. Students will read papers and engage in discussions about the pros and cons of established data practices and learn about the three main components of responsible data management: 1) consent and ownership, 2) privacy and anonymity, and 3) broader impact.

Students will also practice how to collect data, make data-driven decisions, and design data-driven products through group projects as UX designers, researchers, and data scientists.

The course will bring in interdisciplinary perspectives with guest speakers from archive science, engineering, and responsible AI, to provide a holistic view of broader data ecosystems and infrastructures.

Learning outcomes
Students will learn the pros and cons of different data collection, management, and sharing practices through readings, discussions, and case studies.
Students will gain hands-on experience with responsible data management or systems as UX designers, researchers, and data scientists by completing a group project.

Students will also be exposed to interdisciplinary research on important ethical considerations about data, e.g. privacy and consent, and learn to apply this knowledge to real world datasets and technologies through assignments.

**How will you learn**
This course uses a blended strategy of student-led discussions, mini-lectures, and asynchronous assignments. In addition to attending and participating in discussions and lectures, students will be expected to contribute to Canvas discussion and complete a semester-long project that can take one of the following forms: a computational investigation, a systematic literature review, or an evidence-based redesign of an existing data-intensive system.

**How will you be evaluated**
Students will be evaluated on their completion of assignment and their ability to apply knowledge to several short-term assignments and a group project.

**No sharing of course materials**
No materials used in this class, including, but not limited to, lecture hand-outs, videos, assessments (quizzes, exams, papers, projects, homework assignments), in-class materials, review sheets, and additional problem sets, may be shared online or with anyone outside of the class without my explicit, written permission. Unauthorized sharing of materials may facilitate cheating. The University is aware of the sites used for sharing materials, and any materials found online that are associated with you, or any suspected unauthorized sharing of materials, will be reported to Student Conduct and Academic Integrity in the Office of the Dean of Students. These reports can result in initiation of the student conduct process and include charge(s) for academic misconduct, potentially resulting in sanctions, including a grade impact.

**Reading list and schedule**
<table>
<thead>
<tr>
<th>WK1: Introduction</th>
<th>Class overview: CITI training and the Belmont report + Give an example of how to facilitate a discussion session</th>
</tr>
</thead>
</table>
| *Complete CITI training.*  
*Data labor paper* |                                                                                                           |

Assignments
- Weekly readings
- A short (2-paragraph) written response to each reading to be posted by midnight the Monday before class. These responses should not summarize the reading, but instead raise questions that would be appropriate for discussion, or propose ideas to think about
- Participation in discussion
- Everyone will be a discussion leader 1-2 times over the quarter in their discussion groups. Discussion leaders should have read all the response paragraphs and prepared to organize the discussion in their group, synthesize for reporting back to the whole class, and prepare a slide deck to facilitate discussion.
- A final project done in groups of 2-5. This can be a computational investigation (describing a new problem you examined, or a replication of someone else's published work, a theoretical result, etc.), a systematic literature review, or an evidence-based redesign of an existing data-intensive system. The project consists of four components/deadlines
  - Project Presentation
  - Proposal
  - Final presentation
  - Final paper

Late assignments
Late work for reading discussions and presentations will not be accepted since they are a prerequisite for coming to class. Late work for final papers will not be accepted either because of the grading deadline. If you need to submit your project proposal late, your work will be accepted, subject to 5% grade reduction per day of delay.
Use of Generative AI
All writing assignments (including reading discussions, project proposals, and final papers) should be fully prepared by the student. Developing strong competencies in writing, communicating, brainstorming, and project development, will prepare you for success in your degree pathway and, ultimately, a competitive career. Therefore, the use of generative AI tools to complete any aspect of writing assignments for this course are not permitted and will be treated as plagiarism.

You may use ChatGPT or similar generative AI tools to write code if your project involves coding, e.g. running a descriptive analysis of a dataset. In such case, you must provide complete logs for any outputs you use directly and any artifacts you submit should indicate the provenance of any unedited generative AI outputs. For example, “This code was generated with the help of ChatGPT, but heavily edited.”

If you have questions about what constitutes a violation of this statement, please contact me.

Wellbeing and Safety
I urge students who are struggling for any reason and who believe that it might impact their performance in the course to reach out to me if they feel comfortable. This will allow me to provide any resources or accommodations that I can. If you are seeking mental health support, call the Counseling and Mental Health Center (CMHC) at 512-471-3515 (8a.m.-5p.m., Monday-Friday), or you may also contact Bryce Moffett, LCSW-S (iSchool CARE counselor) at 512-232-4449. Bryce’s office is located in FAC18S and she holds drop in Office Hours on Wednesday from 2-3pm. For urgent mental health concerns, please contact the CMHC 24/7 Crisis Line at 512-471-2255.

Disability and Access
The university is committed to creating an accessible and inclusive learning environment consistent with university policy and federal and state law. Please let me know if you experience any barriers to learning so I can work with you to ensure you have equal opportunity to participate fully in this course. If you are a student with a disability, or think you may have a disability, and need accommodations please contact Disability & Access (D&A). Please refer to the D&A website for more information: http://diversity.utexas.edu/disability/. If you are already registered with D&A, please deliver your Accommodation Letter to me as early as possible in the semester so we can discuss your approved accommodations and needs in this course.
